

Self Cleaning Grill Fire

DESCRIPTION

[Para 1] Self Cleaning Grill Fire is a flammable solid mixture of hickory, oak, and/or cherry wood chips, lighter fluid, and wax in a pan that is placed under the cooking portion of a grill and lit. The entire pan becomes one large flame that burns for approximately 5 minutes. The flame cleans the grill in the same fashion as a self-cleaning oven, it gets hot enough to bake away any food or residue from the grill. Additionally, the disposable pan captures any ash during the process. After burning, the grill is clean and ready for barbequing without the use of any chemical cleaning agents. Additionally, it has been "Seasoned" from the wood fire.
